RIGACAP · REGIME-ADAPTIVE MOMENTUM

Momentum, built around the *drawdown.*

A momentum stock-signals platform with one adaptive engine and **two tiers** — Preserver to protect, Maximizer to grow. Both compound through the market's best trends while stepping aside from its worst. The edge isn't chasing the biggest number; it's **the number you can actually hold onto.**

Executive Summary

RigaCap is a momentum stock-signals product built on a single principle: an investor only keeps the returns they can survive. Most momentum strategies post extraordinary long-run numbers on paper, then hand back half of an investor's capital in a crash — at which point most people sell and never come back. RigaCap runs the same trend-following engine but **governs it around the drawdown**, raising cash as market stress builds and re-deploying as conditions repair.

The product ships in **two tiers off one engine**. **Preserver** is the flagship — market-like growth with roughly half the market's drawdown, for investors who want to stay invested through the cycle. **Maximizer** is the aggressive tier — a higher-return breakout book with a mechanical brake on the momentum-crash tail, for growth-seekers who can stomach a rougher year.

> THE THESIS IN ONE LINE
>
> **Behavior beats selection.** The dominant driver of real-world returns isn't which stocks you pick — it's whether you stay in your seat. RigaCap is engineered to be **holdable**: shallow enough drawdowns that a disciplined investor never hits the panic threshold, and a track record built entirely on **walk-forward** testing so the results reflect data the system had never seen.

13.0%	1.28	31.4%	1.51
PRESERVER 5-YR CAGR	PRESERVER SHARPE	MAXIMIZER 5-YR CAGR	MAXIMIZER SHARPE

All figures on this page are **walk-forward** results (out-of-sample; the system was never optimized on the data it was tested against). SPY over the same five-year window: 14.2% CAGR with a –25.4% worst drawdown.

Walk-Forward Performance

BOTH TIERS · OUT-OF-SAMPLE · VS. S&P 500

Every number below is walk-forward: the engine trades forward into data it never saw during development. We report two horizons — a recent **five-year** window and a long **twenty-one-year** window spanning the 2008 crisis, COVID, and the 2022 bear. The point of the long window isn't the headline return; it's *surviving every crisis with the drawdown intact.* The S&P 500 lost more than half its value twice in that span.

Five-Year (recent) — annualized

STRATEGY	CAGR	SHARPE	WORST DRAWDOWN
RigaCap Preserver	13.0%	1.28	−12.9%
RigaCap Maximizer	31.4%	1.51	−14.9%
S&P 500	14.2%	–	−25.4%

Twenty-One-Year — annualized

STRATEGY	CAGR	SHARPE	WORST DRAWDOWN
RigaCap Preserver	7.7%	0.87	−13.7%
RigaCap Maximizer	13.5%	0.93	−20.8%
S&P 500	9.8%	–	−55%

> *Preserver produced a market-beating five-year return at roughly half the market's drawdown. Over twenty-one years it grew capital while never giving back more than 14% — versus 55% for the index.*

What a typical holding period looks like

TIER	TYPICAL 12-MO	POSITIVE 12-MO WINDOWS	TYPICAL 24-MO
Preserver	**+10.7%**	77%	**+20.8%**
Maximizer	**+26.5%**	77%	**+57.5%**

Behavior through the crises

The engine's defining trait is what it does when the market breaks. Across the long window it captured far less of the market's down-months than the market itself — and it recovered faster.

CRISIS YEAR	PRESERVER	MAXIMIZER	S&P 500
2008 — financial crisis	+0.1%	+0.1%	−37.7%
2020 — COVID crash & recovery	+9.2%	+34.9%	+15.2%
2022 — rate-hike bear	−11.2%	−6.4%	−19.9%

Down-month capture & recovery

METRIC (2007–2026)	PRESERVER	MAXIMIZER	S&P 500
Average return in down months	−1.05%	−0.97%	−3.85%
Longest time underwater	2.2 yrs	3.4 yrs	5.4 yrs
Beats SPY over rolling 1 / 3 / 5-yr windows	36 / 17 / 14%	50 / 45 / 31%	—

READ THE LAST ROW HONESTLY

RigaCap does **not** beat the market every year — and it isn't meant to. In a smooth melt-up it will trail. The trade is deliberate: give up a little in the calm years to lose far less in the violent ones, so the compounding never resets and the investor never capitulates at the bottom. That asymmetry — a −1% average down-month against the market's −3.85% — is the whole product.

The Two-Tier Product

ONE ENGINE · YOUR RISK, YOUR CALL

Most services hand you a single strategy and hope it fits. RigaCap is a **risk dial**: the same regime-adaptive engine, tuned to two appetites. An investor picks the tier that matches how much of a rough year they can actually sit through — and we tell them the cost of each choice up front.

FLAGSHIP · PROTECT

Preserver

"Stay invested through the cycle."

For capital-preservers, retirees, advisers, and larger accounts.

13.0%	1.28	–12.9%
5-YR CAGR	SHARPE	MAX DD

Market-like growth at roughly **half the market's drawdown**. A typical year is **+10.7%**, and 77% of rolling twelve-month windows finish positive.

Cost owned: gives up some upside in a calm melt-up. That underperformance in the good years is the premium paid for the shallow losses in the bad ones.

AGGRESSIVE · GROW

Maximizer

"Offense with a seatbelt."

For growth-seekers who can stomach a rougher year.

31.4%	1.51	–14.9%
5-YR CAGR	SHARPE	MAX DD

A higher-return breakout book. A typical year is **+26.5%**, and a typical two-year hold compounds to **+57.5%** — with a mechanical brake on the momentum-crash tail.

Cost owned: a momentum-crash tail — the rare year the trade unwinds. The brake tames it; it is **reduced, not eliminated.** Choose this only if a rough year is one you can live with.

MARKETING AS FILTRATION, NOT CONVERSION

The same product is a poor fit for a return-maximizer and an ideal fit for a capital-preserver. So our job is to route each investor to the right tier — not to sell everyone the same thing. We state each tier's cost plainly: Preserver trails in a smooth melt-up; Maximizer owns a tamed crash tail. **Signals only** — the investor executes at their own broker and retains full discretion.

Regime Intelligence

THE LEVER THAT GOVERNS THE DRAWDOWN

The engine reads the market's state continuously and sizes its exposure to match. When breadth deteriorates, volatility spikes, and trend rolls over together, it raises cash — stepping out of the way of the worst months rather than riding them down. As conditions repair, it re-deploys. This is the single mechanism behind the shallow drawdowns and the low down-month capture shown earlier.

A multi-factor model classifies conditions into a spectrum of regimes using broad-market trend, volatility percentile, market breadth, new-high/new-low behavior, and momentum acceleration. The classification drives exposure, the dashboard context subscribers see, and a short-horizon transition forecast.

Strong Bull Fully invested	**Weak Bull** Invested, watchful	**Rotating Bull** Sector-aware context	**Range-Bound** Caution flagged
Weak Bear Exposure trimmed	**Panic / Crash** Defensive: raise cash	**Recovery** Gradual re-entry	**Forecast** 1–2 week outlook

NOT A SWITCH — A GOVERNOR

The system doesn't just flip between "in" and "out." It scales exposure and raises cash in proportion to stress, then re-enters as the tape repairs. The result across twenty-one walk-forward years: an average down-month of about **–1%** for both tiers, against the market's **–3.85%**, and a longest-underwater stretch of **2.2 years** for Preserver versus **5.4 years** for the index.

AI & Machine Learning

DISCIPLINE OVER CLEVERNESS

RigaCap uses machine learning where it earns its keep and refuses it where it doesn't. Parameters were discovered through systematic search across their full ranges — isolating which levers actually move risk-adjusted returns and which only add noise. The consistent finding: **entry quality and exposure discipline dominate**; over-tuning the rest degrades out-of-sample results.

Robust over optimized

Across many configurations, a single robust parameter set beat aggressively auto-optimized ones out-of-sample. Bayesian optimizers were tested extensively and consistently added noise without adding return. We ship the robust set.

Walk-forward, always

Validation is out-of-sample by construction: at each step the engine trades forward into unseen data with fixed parameters, producing an honest equity curve. Every number in this report comes from that process — never a curve fit to its own data.

Regime as a governor

Rather than micro-tuning parameters per regime, exposure scales with measured market stress. Simpler, more robust, and directly responsible for the low down-month capture.

Content generation, on rails

Language models turn real, completed trades into social proof — data-driven posts from actual results, every one passing through human approval before it publishes. AI does the drafting; a person keeps the keys.

FULL-HISTORY, PENNY-TO-PENNY VALIDATION

Research results are only trusted once they reproduce through the exact production day-step on the same warm-started history that live trading uses. A promising idea

> that can't survive that reproduction never ships. Metrics tracked per period include Sharpe, Sortino, Calmar, profit factor, win rate, recovery factor, and the Ulcer index.

Platform Architecture

SERVERLESS · RESILIENT · LOW-COST TO SCALE

React Dashboard Tailwind + charts → **CDN** Global edge cache → **API Gateway** REST → **Serverless API** FastAPI on Lambda → **Data Layer** PostgreSQL + cache

Data Pipeline

- Broad US-equity universe scanned daily
- 20+ years of split/dividend-adjusted history
- Dual-source market data with automatic failover
- Point-in-time, survivorship-free construction
- Pre-computed dashboard cache served from the edge

Operational Cadence

- End-of-day market scan after the close
- Intraday exit / sell alerts
- Subscriber email digest each evening
- Nightly walk-forward & social pipeline
- Data-freshness gate holds any stale communication

What subscribers see

Buy signals

Ranked, regime-aware picks with a clear instruction — enter now, or watch — never a raw list to guess at.

Portfolio guidance

Position-level exit guidance and trailing-stop distances for open positions, matched exactly to the live engine's rules.

Market regime

The current regime with a plain-language read and a one-to-two-week outlook, so the context behind every signal is visible.

Your journey

A personalized, shareable view of what following the signals would have earned from a given start date, versus the market.

SECURITY POSTURE

Google / Apple / email sign-in with hashed passwords and JWT sessions; bot protection at the edge; private storage with no public signal data; strict CORS; admin-only routes; and payments handled entirely by a PCI-compliant processor. Signals are impersonal — no custody, no client trading authority.

Growth & Roadmap

TWO CHANNELS · ONE ENGINE

RigaCap sells into two channels off the same product. The **retail** channel grows through social proof from real trades, automated content, and conversion-optimized funnels. The **adviser** channel — independent RIAs — licenses the strategy as a sleeve inside client portfolios, changing the unit economics entirely: a firm license is priced well above a retail seat, spread across client assets, closed through a conversation rather than a paid funnel, and near-zero marginal cost.

> WHY THE PRODUCT FITS THE ADVISER
>
> An adviser's core business risk is the client who capitulates at the bottom. RigaCap's entire pitch is that exact risk, quantified: a shallow worst drawdown across twenty-one walk-forward years, a down-month capture near a third of the market's, and a **sit-out-the-crash record** through the market's worst months. Positioned as a 10–20% sleeve, it lets an adviser add behavioral protection without abandoning their core allocation. Signals only — the adviser keeps all discretion and fiduciary duty.

Roadmap

- **Now — social proof engine (live)**

  AI-drafted, human-approved posts generated nightly from real completed trades; public track-record page; referral program; onboarding drip that pre-sets honest expectations to reduce churn.

- **Next — two-tier rollout**

  Preserver as the flagship base with Maximizer as a paid add-on; adviser product surface with sleeve framing, re-entry explanation, and client-education one-pagers.

- **Then — retention & engagement**

  Personalized performance dashboard, cancel-survey and win-back flows, usage-based retention alerts, and expectation-setting content for multi-year holds.

- **Later — scale**

Organic content and SEO, disciplined paid acquisition on on-thesis queries, and a deepening independent-RIA channel as the live record lengthens.

> *The credibility that unlocks the adviser channel is time. Every month of live results compounds the case — which is exactly why the honest, walk-forward posture of this document is the strategy, not the disclaimer.*

RigaCap

Regime-Adaptive Momentum · `rigacap.com`

Confidential and intended solely for the recipient. All performance figures are **walk-forward** (out-of-sample but simulated) — not live trading results. Data is survivorship-free and point-in-time where noted. RigaCap provides trading signals only; subscribers and advisers execute at their own brokers and retain full discretion. This is not financial advice. Past results do not guarantee future returns; trading involves risk of loss.
